

environmental and natural resource economics

Environmental and Natural Resource Economics: Understanding the Balance Between Growth and Sustainability

environmental and natural resource economics is a fascinating and crucial field that explores how societies use natural resources and manage the environment while promoting economic growth and sustainability. As the world grapples with climate change, resource depletion, and environmental degradation, this branch of economics has become more important than ever. It delves into the complex relationships between economic activity and the environment, seeking ways to achieve efficient resource allocation without compromising the planet's health for future generations.

What Is Environmental and Natural Resource Economics?

At its core, environmental and natural resource economics studies how economic systems interact with natural resources — such as water, forests, minerals, and clean air — and how these interactions affect both economic development and the environment. Unlike traditional economics, which often assumes unlimited resources, this field recognizes the scarcity and finite nature of natural assets. It also highlights externalities, or costs and benefits that affect third parties, which are common in environmental issues.

This discipline combines insights from economics, ecology, and policy studies to inform decisions that balance growth with conservation. For example, it examines how pollution impacts public health and productivity, or how overfishing threatens marine biodiversity and the livelihoods of fishing communities.

The Role of Market Failures and Externalities

One of the foundational concepts in environmental and natural resource economics is market failure. Markets sometimes fail to allocate resources efficiently because environmental costs—like pollution or habitat destruction—aren't reflected in prices. These externalities lead to overconsumption or degradation of natural resources.

Addressing these failures is essential. Economists suggest tools such as:

- **Pigovian taxes:** Taxes imposed on activities that generate negative externalities, incentivizing firms and individuals to reduce harmful environmental impacts.
- **Tradable permits:** Market-based approaches like cap-and-trade systems that set pollution limits while allowing firms to buy and sell emission rights.

- **Subsidies for clean technologies:** Encouraging innovation and adoption of environmentally friendly practices.

These instruments help align private incentives with social welfare, promoting sustainable use of resources.

Natural Resource Management and Sustainability

Sustainable management of natural resources is a key focus within environmental and natural resource economics. It involves ensuring that extraction and use today do not compromise availability for future generations. This balance is challenging since economic pressures often push for short-term gains.

Renewable vs. Non-renewable Resources

Understanding the difference between renewable and non-renewable resources is essential in this field. Renewable resources, like forests, fisheries, and freshwater, can replenish over time if managed responsibly. Non-renewable resources, such as fossil fuels and minerals, exist in finite quantities and can be exhausted.

Economists analyze optimal extraction rates and policies that promote conservation. For instance, setting quotas on fishing limits or forest harvesting can maintain stock levels. Meanwhile, for non-renewable resources, finding substitutes or investing in energy efficiency can reduce dependence and extend resource lifespans.

Intertemporal Decision-Making

Environmental and natural resource economics often involves intertemporal analysis — how decisions made today affect the future. This includes concepts like discounting, which determines how future benefits and costs are valued relative to the present.

Choosing the right discount rate is contentious because it influences investment in environmental protection. A high discount rate undervalues future benefits, potentially leading to overexploitation. Conversely, a lower rate emphasizes long-term sustainability, encouraging preservation efforts.

Economic Instruments for Environmental Policy

Policymakers rely on various economic tools derived from environmental and natural resource economics to design effective environmental regulations.

Taxes and Charges

Environmental taxes, often called green taxes, are designed to internalize the external costs of pollution and resource depletion. Examples include carbon taxes on greenhouse gas emissions or levies on plastic bags to reduce waste.

These taxes encourage behavioral change by making environmentally damaging activities more expensive. They also generate revenue that governments can reinvest in renewable energy or conservation programs.

Cap-and-Trade Systems

Cap-and-trade is a market-based approach where a government sets a maximum allowable level of pollution (the cap) and issues permits that total this limit. Firms can trade these permits, allowing businesses that reduce emissions cheaply to sell excess allowances to others.

This system offers flexibility and cost-effectiveness, incentivizing innovation in pollution control. The European Union Emissions Trading System (EU ETS) is one of the largest examples, aiming to reduce carbon emissions across member states.

Subsidies and Incentives

Subsidizing clean energy technologies, such as solar or wind power, helps overcome initial cost barriers and promotes adoption. Incentives can also target energy efficiency improvements or sustainable agriculture practices.

While subsidies can accelerate environmental goals, they must be designed carefully to avoid unintended consequences or market distortions.

The Importance of Valuing Ecosystem Services

One challenge in environmental and natural resource economics is quantifying the value of ecosystem services — benefits that nature provides to humans, including clean air, water filtration, pollination, and climate regulation.

These services are often overlooked because they don't have explicit market prices, yet their loss can have profound economic and social impacts. Economists use methods like contingent valuation (surveys asking people their willingness to pay for environmental benefits) or hedonic pricing (analyzing how environmental factors affect property values) to estimate these values.

Recognizing ecosystem services in economic decision-making helps justify conservation efforts and informs cost-benefit analyses of development projects.

Natural Capital Accounting

An emerging approach is incorporating natural capital into national accounting systems, alongside traditional measures like GDP. This practice aims to provide a more comprehensive picture of a country's wealth, including forests, water resources, and biodiversity.

By doing so, policymakers can better assess whether economic growth is sustainable or achieved at the expense of natural capital depletion.

Climate Change and Environmental Economics

Climate change is one of the most pressing issues where environmental and natural resource economics plays a vital role. Economists analyze the costs and benefits of mitigation and adaptation strategies to guide effective policy.

Carbon Pricing

Carbon pricing mechanisms, such as carbon taxes or cap-and-trade, are central tools to reduce greenhouse gas emissions. By putting a price on carbon, these policies encourage shifts toward low-carbon technologies and energy sources.

The challenge lies in setting the right price level that balances economic impacts with environmental goals, as well as ensuring equity so vulnerable populations are not disproportionately affected.

Cost-Benefit Analysis of Climate Policies

Evaluating climate policies requires comparing short-term costs against long-term benefits, often under uncertainty. Environmental and natural resource economics provides frameworks to assess these trade-offs, incorporating factors like discount rates, risk preferences, and intergenerational equity.

Such analyses inform international agreements and national strategies, helping allocate resources efficiently to combat climate change.

Integrating Social and Environmental Justice

Modern environmental and natural resource economics increasingly recognizes the importance of equity and justice. Environmental burdens, such as pollution and resource scarcity, often disproportionately affect marginalized communities.

Addressing these disparities involves incorporating social considerations into economic models and policies. Concepts like the "just transition" aim to ensure that shifts toward sustainable economies do

not leave workers or vulnerable groups behind.

Community-Based Resource Management

Empowering local communities to manage natural resources has shown promising results in both economic efficiency and social equity. This bottom-up approach recognizes that local knowledge and stakeholder participation can lead to more sustainable and accepted outcomes.

Policies that support community rights and access to resources, alongside technical and financial assistance, can enhance conservation efforts while improving livelihoods.

Emerging Trends and Future Directions

The field of environmental and natural resource economics continues to evolve as new challenges and technologies emerge.

Behavioral Economics and Environmental Decisions

Understanding how people make environmental choices beyond purely rational models is gaining attention. Insights from behavioral economics help design better policies by accounting for biases, heuristics, and social norms.

For example, “nudges” such as default renewable energy options or social comparisons in energy use can encourage greener behaviors without heavy-handed regulation.

Technological Innovation and Green Growth

Technological advances in clean energy, resource efficiency, and pollution control offer pathways to decouple economic growth from environmental harm. Environmental and natural resource economics studies how to incentivize innovation and diffusion of green technologies.

This includes examining intellectual property rights, market structures, and international cooperation to speed up global transitions to sustainability.

Global Perspectives and Cooperation

Environmental challenges are inherently global, requiring cross-border collaboration. International environmental agreements, trade policies, and finance mechanisms are key areas where environmental economics informs negotiations and implementation.

Issues like biodiversity loss, ocean health, and climate change highlight the need for coordinated

economic policies that transcend national boundaries.

Environmental and natural resource economics provides vital tools and frameworks to navigate the complex interplay between economic development and environmental stewardship. By understanding economic incentives, externalities, resource dynamics, and social equity, this field helps craft policies that aim for a sustainable and prosperous future for all. As we continue to face environmental challenges on unprecedented scales, the insights from this discipline will be ever more essential in shaping a balanced path forward.

Frequently Asked Questions

What is environmental and natural resource economics?

Environmental and natural resource economics is a field of economics that studies the economic impacts of environmental policies and the management of natural resources, focusing on the efficient allocation and sustainable use of these resources.

Why is environmental economics important in today's world?

Environmental economics is important because it helps address critical issues such as climate change, pollution, and resource depletion by providing tools to evaluate the costs and benefits of environmental policies and promote sustainable development.

How do economists value natural resources and ecosystem services?

Economists use various valuation methods such as contingent valuation, travel cost method, and hedonic pricing to estimate the economic value of natural resources and ecosystem services that are not traded in markets.

What role do externalities play in environmental economics?

Externalities occur when the actions of individuals or firms impose costs or benefits on others not reflected in market prices. Environmental economics studies these externalities, such as pollution, and designs policies like taxes or regulations to internalize these external costs.

How can market-based instruments help in managing natural resources?

Market-based instruments, such as carbon taxes, tradable permits, and subsidies for clean technology, create economic incentives for reducing environmental damage and promoting sustainable resource use, often leading to cost-effective solutions.

What is the concept of sustainable development in environmental economics?

Sustainable development refers to meeting the needs of the present without compromising the ability of future generations to meet their own needs, balancing economic growth, environmental protection, and social equity.

How do natural resource economists address the problem of resource depletion?

They analyze optimal extraction rates, consider the scarcity and regeneration rates of resources, and recommend policies such as quotas, taxes, or property rights to ensure sustainable use and conservation of resources.

What impact does climate change have on natural resource economics?

Climate change affects resource availability, agricultural productivity, and ecosystem services, leading natural resource economists to study adaptation strategies, mitigation policies, and the economic costs of climate impacts.

How do policies like carbon pricing influence environmental outcomes?

Carbon pricing assigns a cost to carbon emissions, encouraging businesses and consumers to reduce their carbon footprint, invest in cleaner technologies, and ultimately lower greenhouse gas emissions, supporting environmental objectives.

Environmental and Natural Resource Economics: Navigating Sustainability and Market Dynamics

environmental and natural resource economics is a critical discipline that intersects economic principles with ecological realities, aiming to understand how societies can efficiently manage natural resources while minimizing environmental degradation. As the global community increasingly confronts challenges such as climate change, biodiversity loss, and resource scarcity, this branch of economics provides essential frameworks for policy formulation, sustainable development, and environmental stewardship.

Understanding Environmental and Natural Resource Economics

At its core, environmental and natural resource economics examines how economic activities impact the environment and how natural resources can be allocated optimally. Unlike traditional economics,

which often assumes unlimited resources, this field recognizes the finite nature of ecological assets and the externalities—costs or benefits not reflected in market prices—that arise from environmental interactions.

The discipline addresses two main categories: environmental economics, which focuses on pollution, waste management, and ecosystem services; and natural resource economics, which deals with the extraction, use, and conservation of resources like water, minerals, forests, and fisheries. Together, they analyze how market failures, such as public goods and externalities, affect resource use and propose corrective mechanisms.

Key Concepts and Theoretical Foundations

Environmental and natural resource economics builds upon several foundational theories:

- **Externalities:** Negative externalities, such as pollution, create social costs that are not borne by producers or consumers, leading to overuse or degradation of resources.
- **Common-Pool Resources:** Resources like fisheries and forests are often susceptible to overexploitation due to their non-excludable yet rivalrous nature, famously described as the “tragedy of the commons.”
- **Discounting and Intergenerational Equity:** Since resource use impacts future generations, this concept deals with how current decisions weigh the welfare of future populations.
- **Valuation of Ecosystem Services:** Assigning economic value to non-market benefits provided by ecosystems, such as carbon sequestration and biodiversity, is essential for informed policy-making.

These concepts enable economists and policymakers to design instruments like taxes, subsidies, tradable permits, and regulations to correct market inefficiencies.

Policy Instruments in Environmental and Natural Resource Economics

Governments and international bodies employ a variety of tools informed by environmental and natural resource economics to balance economic growth and ecological sustainability.

Market-Based Instruments

Market-based approaches leverage economic incentives to influence behavior effectively.

- **Carbon Pricing:** Implemented through carbon taxes or cap-and-trade systems, these mechanisms internalize the social cost of greenhouse gas emissions, encouraging firms to innovate and reduce their carbon footprint.
- **Tradable Permits:** These create a market for pollution rights, promoting cost-efficient pollution reductions and enabling flexibility among emitters.
- **Subsidies for Renewable Energy:** Financial incentives lower the cost of sustainable technologies, accelerating their adoption and reducing dependence on fossil fuels.

Such instruments often demonstrate greater cost-effectiveness compared to direct regulation but require robust monitoring and enforcement frameworks.

Regulatory Approaches

Command-and-control regulations remain prevalent, especially where market mechanisms face implementation challenges.

- **Emission Standards:** Setting legal limits on pollutants helps protect public health and environmental quality.
- **Resource Extraction Quotas:** Limits on fishing or logging aim to prevent overexploitation and maintain ecosystem resilience.
- **Protected Areas and Conservation Policies:** These safeguard biodiversity hotspots and critical habitats from development pressures.

While effective in certain contexts, such regulations can sometimes impose higher compliance costs and lack flexibility.

Challenges and Contemporary Debates

Environmental and natural resource economics grapples with complex issues that reflect the dynamic interplay between economic growth and environmental limits.

Valuation Difficulties

Assigning monetary values to ecosystem services and biodiversity remains contentious. Non-market values are difficult to quantify, and methodologies like contingent valuation or hedonic pricing carry inherent uncertainties. These challenges complicate cost-benefit analyses and may lead to underinvestment in conservation.

Climate Change and Economic Adaptation

As climate change intensifies, economists focus on mitigation strategies and adaptation costs. Estimating the social cost of carbon, which aggregates projected damages from emissions, is vital but varies widely depending on discount rates and damage functions. Moreover, evaluating the economic impacts of extreme weather events highlights the need for resilient infrastructure and adaptive policies.

Equity and Access to Resources

Natural resource allocation often intersects with social justice concerns. Indigenous communities, marginalized groups, and developing nations may face disproportionate environmental burdens or limited access to resources. Environmental and natural resource economics increasingly incorporates equity considerations to promote inclusive and sustainable outcomes.

Applications and Case Studies

Environmental and natural resource economics informs diverse real-world scenarios, from local conservation efforts to global environmental agreements.

Fisheries Management

Overfishing has led to the collapse of numerous fish stocks worldwide. Economic models help establish catch limits and design tradable quota systems that align incentives for sustainable harvesting. For example, New Zealand's Quota Management System is heralded for balancing economic viability with ecological preservation.

Forest Conservation and Carbon Markets

Forests serve as critical carbon sinks. Programs like REDD+ (Reducing Emissions from Deforestation and Forest Degradation) use economic incentives to encourage developing countries to conserve forests, linking environmental outcomes with financial rewards. These initiatives illustrate how market-based approaches can address deforestation while supporting local livelihoods.

Urban Environmental Policies

Cities face unique challenges regarding air pollution, waste management, and green space preservation. Environmental economics guides policies such as congestion pricing and green infrastructure investments, fostering healthier urban environments and efficient resource use.

The Future Trajectory of Environmental and Natural Resource Economics

As global environmental pressures mount, the relevance of environmental and natural resource economics will only deepen. Emerging areas such as behavioral economics integration, ecosystem service modeling, and climate finance innovation promise to enrich the field's analytical toolkit. Furthermore, advances in data analytics and remote sensing enable more precise resource monitoring and valuation.

Interdisciplinary collaboration between economists, ecologists, and policymakers is crucial to developing holistic solutions that reconcile economic development with ecological sustainability. Ultimately, environmental and natural resource economics serves as an indispensable lens through which society can navigate the complexities of a finite planet.

Environmental And Natural Resource Economics

environmental and natural resource economics: Environmental and Natural Resource Economics Jonathan M. Harris, Brian Roach, 2017-06-26 Environmental issues are of fundamental importance, and a broad approach to understanding the relationship of the human economy and the natural world is essential. In a rapidly changing policy and scientific context, this new edition of Environmental and Natural Resource Economics reflects an updated perspective on modern environmental topics. Now in its fourth edition, this book includes new material on climate change, the cost-competitiveness of renewable energy, global environmental trends, and sustainable economies. The text provides a balanced treatment of both standard environmental economics and ecological economics, based on the belief that these two approaches are complementary. Several chapters focus on the core concepts of environmental economics, including the theory of externalities, the management of public goods, the allocation of resources across time, environmental valuation, and cost-benefit analysis. Material on ecological economics includes such topics as macroeconomic scale, entropy, and green national accounting. Topical chapters focus on: energy; climate change; water resources; international trade; forests; fisheries; and agriculture, with an emphasis on designing effective policies to promote sustainability and a green economy. Harris and Roach's premise is that a pluralistic approach is essential to understand the complex nexus between the economy and the environment. This perspective, combined with its emphasis on real-world policies, is particularly appealing to both instructors and students. This is the ideal text for classes on environmental, natural resource, and ecological economics. The book's companion website is available at:

<http://www.bu.edu/eci/education-materials/textbooks/environmental-and-natural-resource-economics/>

environmental and natural resource economics: Environmental and Natural Resource Economics Thomas H. Tietenberg, 1988 Continuing the trend toward a more international focus, Tietenberg's Fifth Edition increases attention paid to environmental problems and policies in Europe, China, and developing nations.

environmental and natural resource economics: Environmental and Natural Resources Economics Steven Hackett, Sahan T. M. Dissanayake, 2014-12-18 Extensively revised and updated, this popular text presents an accessible yet rigorous treatment of environmental and natural resources economics, including climate change and the economics of sustainability. Completely

revised and updated, the fourth edition now includes new figures and tables, definitions to assist the reader, and updated policy information. New advances in the science, economics and policy approaches to climate change have been integrated into essentially all-new chapters on incentive regulation and global climate change. This innovative textbook integrates economics with science and public policy in a balanced and accessible way that will be appreciated by students from disciplines ranging from economics and natural resources management to environmental studies and energy policy.

environmental and natural resource economics: Environmental and Natural Resource Economics Tom Tietenberg, Lynne Lewis, 2023-07-31 Environmental and Natural Resource Economics is one of the most widely used textbooks for environmental economics and natural resource economics courses, offering a policy-oriented approach and introducing economic theory and empirical work from the field. Students will develop a global perspective of both environmental and natural resource economics and how they interact. This 12th edition provides updated data, new studies, and more international examples. There is a considerable amount of new material, with a deeper focus on climate change and coverage of COVID-19, social justice, and the circular economy. Key features include: Extensive coverage of major contemporary issues including climate change, water and air pollution, resource allocation, biodiversity protection, sustainable development, and environmental justice. Four chapters specifically devoted to climate economics, including chapters on energy, climate mitigation, carbon pricing, and adaptation to climate change. Introductions to the theory and method of environmental economics, including externalities, benefit-cost analysis, valuation methods, and ecosystem goods and services and updates to the social cost of carbon. New examples and debates throughout the text, highlighting global cases and major talking points. Environmental and Natural Resource Economics supports students with end-of-chapter summaries, discussion questions, exercises, and further reading in the book, and the companion website offers additional learning and teaching resources.

environmental and natural resource economics: Environmental and Natural Resource Economics Timothy C. Haab Ph.D., John C. Whitehead, 2014-03-28 Accessible to students and practitioners without an advanced degree in environmental economics, this essential reference work pinpoints the role of the economy in both creating and solving many of the world's most pressing environmental challenges. Given the number and scope of environmental problems we face today, everyone from high school students to policy makers to concerned citizens should understand how the economy works and grasp how meltdowns—both economic and environmental in nature—can be avoided. Environmental and Natural Resource Economics: An Encyclopedia offers the critical information needed to comprehend these complex issues. The entries cover topics in a manner parallel to how environmental economics is commonly taught, addressing basic concepts, environmental policy, natural resource economics, market failure, exhaustible and renewable resources, benefit-cost analysis, and applied welfare economics. Additionally, the book includes entries on key concepts of economics, movements, events, organizations, important individuals, and research areas relevant to the study of environmental and natural resource economics. This work stands alone as the only title currently offering such a breadth of coverage and level of detail written specifically for readers without specialized knowledge of environmental economics.

environmental and natural resource economics: Teaching Environmental and Natural Resource Economics Bergstrom, John C., Whitehead, John C., 2022-01-13 Teaching Environmental and Natural Resource Economics is a significant contribution to the literature of economics education. Theory and practice, teaching activities and exercises, and pro teaching tips are clearly and expertly presented. This guide will prove invaluable in helping students gain a better understanding of the theory and practice of environmental and natural resource economics.

environmental and natural resource economics: Environmental and Natural Resources Economics Steven C. Hackett, 1998 Integrating aspects of philosophy, political science, and some environmental science, this text provides a multidisciplinary approach to environmental economics and natural resources policy. Included is a chapter on value systems and the role of ethics.

environmental and natural resource economics: *The Economics of the Environment and Natural Resources* Quentin Grafton, Wiktor Adamowicz, Diane Dupont, Harry Nelson, Robert J. Hill, Steven Renzetti, 2008-04-15 The Economics of the Environment and Natural Resources covers the essential topics students need to understand environmental and resource problems and their possible solutions. Its unique lecture format provides an in-depth exploration of discrete topics, ideal for upper-level undergraduate, graduate or doctoral study. Each chapter depicts the key theoretical insights, major issues, and real-life problems that motivate the subject. In addition, the chapters feature practical applications and case studies, a list of annotated further reading, and extensive references. Offers broad treatment of issues in Environmental and Resource Economics. Provides in-depth exploration of a wide range of topics with its unique lecture format. Depicts key theoretical insights, major issues, and real-life problems for each subject. Features case studies, annotated further reading, extensive references, and a detailed glossary.

environmental and natural resource economics: Natural Resource Economics: The Essentials Tom Tietenberg, Lynne Lewis, 2019-08-01 Natural Resource Economics: The Essentials offers a policy-oriented approach to the increasingly influential field of natural resource economics that is based upon a solid foundation of economic theory and empirical research. Students will not only leave the course with a firm understanding of natural resource economics, but they will also be exposed to a number of case studies showing how underlying economic principles provide the basis for specific natural resource policies. Including current data and research studies, this key text also highlights what insights can be derived from the actual experience. Key features include: Extensive coverage of the major issues including energy, recyclable resources, water policy, land conservation and management, forests, fisheries, other ecosystems, and sustainable development; Introductions to the theory and method of natural resource economics including externalities, experimental and behavioral economics, benefit-cost analysis, and methods for valuing the services provided by the environment; Boxed 'Examples' and 'Debates' throughout the text which highlight global examples and major points for deeper discussions. The text is fully supported with end-of-chapter summaries, discussion questions, and self-test exercises in the book, as well as with multiple-choice questions, simulations, references, slides, and an instructor's manual on the Companion Website. This text is adapted from the best-selling Environmental and Natural Resource Economics, 11th edition, by the same authors.

environmental and natural resource economics: **Environmental & Natural Resource Economics, Global Edition** Tom Tietenberg, Lynne Lewis, 2015-01-28 For courses in environmental economics Environmental & Natural Resource Economics is the best-selling text for this course, offering a policy-oriented approach and introducing economic theory in the context of debates and empirical work from the field. Students leave the course with a global perspective of both environmental and natural resource economics. Gain flexibility in your course outlines: The text is organized, so that you can fit individual course outlines. Use relevant material: Students identify with up-to-date information, which gives them a global perspective on key issues. Engage students with self-test exercises, debates and examples: Students are able to prepare for their field and learn from an active learning path, which allows them to grasp concepts before moving through the text.

environmental and natural resource economics: **Environmental and Natural Resource Economics** Jonathan M. Harris, 2002 Environmental problems and their local, national, and global solutions have taken on ever-increasing importance in today's world. Economic analysis of environmental problems is essential, but economic perspectives must be complemented with an understanding of the principles of ecological systems. [This book] offers an introduction to the broad perspectives

environmental and natural resource economics: Environmental Economics and Policy Thomas H. Tietenberg, Lynne Lewis, 2009 Suitable for use on a policy-oriented course in environmental economics, accessible to both majors and non-majors, this book begins with a brief introduction to the core theory, and then offers a series of self-contained policy chapters that allow professors great flexibility when planning their course.

environmental and natural resource economics: Environmental and Natural Resource Economics Timothy C. Haab, John C. Whitehead, 2014-03-28 Accessible to students and practitioners without an advanced degree in environmental economics, this essential reference work pinpoints the role of the economy in both creating and solving many of the world's most pressing environmental challenges. Given the number and scope of environmental problems we face today, everyone from high school students to policy makers to concerned citizens should understand how the economy works and grasp how meltdowns—both economic and environmental in nature—can be avoided. *Environmental and Natural Resource Economics: An Encyclopedia* offers the critical information needed to comprehend these complex issues. The entries cover topics in a manner parallel to how environmental economics is commonly taught, addressing basic concepts, environmental policy, natural resource economics, market failure, exhaustible and renewable resources, benefit-cost analysis, and applied welfare economics. Additionally, the book includes entries on key concepts of economics, movements, events, organizations, important individuals, and research areas relevant to the study of environmental and natural resource economics. This work stands alone as the only title currently offering such a breadth of coverage and level of detail written specifically for readers without specialized knowledge of environmental economics.

environmental and natural resource economics: Environmental and Natural Resource Economics Kentaka Aruga, 2022-02-07 This textbook discusses environmental and natural resource economics. It presents foundational knowledge for applying economics to understand environmental economics as well as for managing environmental problems and optimizing the level of natural resource extraction. *Environmental and Natural Resource Economics* bridges knowledge between the major natural environmental issues and which economic policies could be applied for reducing human impacts on such issues. It is distinctive from other environmental economics textbooks by covering not only basic concepts introduced in environmental economics but also explains economic models developed in resource economics for optimizing the use of non-renewable and renewable resources for sustainability. This textbook will help students understand how to apply economics for utilizing policies to mitigate environmental issues caused from the output side of economic activities such as emitting pollutants or generating wastes and those derived from the input side such as natural resource extractions.

environmental and natural resource economics: The Economics of Environmental and Natural Resources Policy John Alfred Butlin, 2021-06-02 The purpose of this collection of readings is to aid the student taking a course in environmental economics to place the issues in perspective. The text is designed for an undergraduate audience, and those readings that have appeared elsewhere have, with the permission of the holders of the copyright, been suitably abridged for this purpose. The book is designed to be used in conjunction with a conventional text on environmental economics or as an adjunct to a comprehensive series of lectures in environmental and natural resource economics.

environmental and natural resource economics: Guide to the Field of Environmental and Natural Resource Economics Carollyne Hutter,

environmental and natural resource economics: Resource Economics John C. Bergstrom, Alan Randall, 2016-06-24 *Resource Economics* engages students and practitioners in natural resource and environmental issues from both local and global standpoints. The fourth edition of this approachable but rigorous text provides a new focus on risk and uncertainty as well as new applications that address the effect of new energy technologies on scarcity and climate change mitigation and adaptation, while preserving and systematically updating the approach and key features that drew many thousands of readers to the first three editions.

environmental and natural resource economics: Environmental & Natural Resource Economics Thomas H. Tietenberg, Lynne Lewis, 2009 This 8th edition offers a wealth of new examples and hot topics, such as genetically modified organisms and the cost effectiveness of new transportation fuels. The international edition also considers environmental problems and policies in Western Europe, China and the developing nations.

environmental and natural resource economics: Environmental and Natural Resource Economics Jonathan M. Harris, Brian Roach, 2017-06-26 Environmental issues are of fundamental importance, and a broad approach to understanding the relationship of the human economy and the natural world is essential. In a rapidly changing policy and scientific context, this new edition of Environmental and Natural Resource Economics reflects an updated perspective on modern environmental topics. Now in its fourth edition, this book includes new material on climate change, the cost-competitiveness of renewable energy, global environmental trends, and sustainable economies. The text provides a balanced treatment of both standard environmental economics and ecological economics, based on the belief that these two approaches are complementary. Several chapters focus on the core concepts of environmental economics, including the theory of externalities, the management of public goods, the allocation of resources across time, environmental valuation, and cost-benefit analysis. Material on ecological economics includes such topics as macroeconomic scale, entropy, and green national accounting. Topical chapters focus on: energy; climate change; water resources; international trade; forests; fisheries; and agriculture, with an emphasis on designing effective policies to promote sustainability and a green economy. Harris and Roach's premise is that a pluralistic approach is essential to understand the complex nexus between the economy and the environment. This perspective, combined with its emphasis on real-world policies, is particularly appealing to both instructors and students. This is the ideal text for classes on environmental, natural resource, and ecological economics. The book's companion website is available at:
<http://www.bu.edu/eci/education-materials/textbooks/environmental-and-natural-resource-economics/>

environmental and natural resource economics: Environmental & Natural Resources Economics Tom Tietenberg, Lynne Lewis, 2011-11-21 This is the eBook of the printed book and may not include any media, website access codes, or print supplements that may come packaged with the bound book. Environmental and Natural Resource Economics takes a policy-oriented approach, introducing economic theory in the context of debates and empirical work from the field. Readers will gain a global perspective of both environmental and natural resource economics.
