One goal of this book is to convince research departments that they should value quality instruction, not just because of its importance to the mission of the university, but also because of its importance to the overall health of a research mathematics department. To protect the resources you have in times of budget cuts or to seek increased resources, you must match what you are accomplishing with the mission and priorities of the university. ... You should never tire of reminding your administration that the existence of your doctoral program and your research are defining characteristics of the university. ... It is your responsibility to convince your administration that an excellent undergraduate mathematics program is worth paying for. We have a simple message: To ensure their institution's commitment to excellence in mathematics research, doctoral departments must pursue excellence in their instructional programs.

applied mathematics university of washington: *Sobolev Met Poincare* Piotr Hajlasz, Pekka Koskela, 2000 There are several generalizations of the classical theory of Sobolev spaces as they are necessary for the applications to Carnot-Carathéodory spaces, subelliptic equations, quasiconformal mappings on Carnot groups and more general Loewner spaces, analysis on topological manifolds, potential theory on infinite graphs, analysis on fractals and the theory of Dirichlet forms. The aim of this paper is to present a unified approach to the theory of Sobolev spaces that covers applications to many of those areas. The variety of different areas of applications forces a very general setting. We are given a metric space X equipped with a doubling measure μ . A generalization of a Sobolev function and its gradient is a pair $u \in L^1_{\text{loc}}(X)$, $0 \leq g \in L^p(X)$ such that for every ball $B \subset X$ the Poincaré-type inequality $\int_B |u - u_B| \, d\mu \leq C r (\int_B g^p \, d\mu)^{1/p}$ holds, where r is the radius of B and $\sigma \geq 1$, $C > 0$ are fixed constants. Working in the above setting we show that basically all relevant results from the classical theory have their counterparts in our general setting. These include Sobolev-Poincaré type embeddings, Rellich-Kondrachov compact embedding theorem, and even a version of the Sobolev embedding theorem on spheres. The second part of the paper is devoted to examples and applications in the above mentioned areas.

applied mathematics university of washington: **Existence of the Sectional Capacity** Robert Rumely, Chi Fong Lau, Robert Varley, 2000 In the case where the norms are induced by metrics on the fibres of $\mathcal{L}$, we establish the functoriality of the sectional capacity under base change, pullbacks by finite surjective morphisms, and products. We study the continuity of S

$\Gamma(\overline{\mathcal{L}})$ under variation of the metric and line bundle, and we apply this to show that the notion of v -adic sets in $X(\mathbb{C}_v)$ of capacity 0 is well-defined. Finally, we show that sectional capacities for arbitrary norms can be well-approximated using objects of finite type.

applied mathematics university of washington: Special Groups M. A. Dickmann, Francisco Miraglia, 2000 This monograph presents a systematic study of Special Groups, a first-order universal-existential axiomatization of the theory of quadratic forms, which comprises the usual theory over fields of characteristic different from 2, and is dual to the theory of abstract order spaces. The heart of our theory begins in Chapter 4 with the result that Boolean algebras have a natural structure of reduced special group. More deeply, every such group is canonically and functorially embedded in a certain Boolean algebra, its Boolean hull. This hull contains a wealth of information about the structure of the given special group, and much of the later work consists in unveiling it. Thus, in Chapter 7 we introduce two series of invariants living in the Boolean hull, which characterize the isometry of forms in any reduced special group. While the multiplicative series--expressed in terms of meet and symmetric difference--constitutes a Boolean version of the Stiefel-Whitney invariants, the additive series--expressed in terms of meet and join--, which we call Horn-Tarski invariants, does not have a known analog in the field case; however, the latter have a considerably more regular behaviour. We give explicit formulas connecting both series, and compute explicitly the invariants for Pfister forms and their linear combinations. In Chapter 9 we combine Boolean-theoretic methods with techniques from Galois cohomology and a result of Voevodsky to obtain an affirmative solution to a long standing conjecture of Marshall concerning quadratic forms over formally real Pythagorean fields. Boolean methods are put to work in Chapter 10 to obtain information about categories of special groups, reduced or not. And again in Chapter 11 to initiate the model-theoretic study of the first-order theory of reduced special groups, where, amongst other things we determine its model-companion. The first-order approach is also present in the study of some outstanding classes of morphisms carried out in Chapter 5, e.g., the pure embeddings of special groups. Chapter 6 is devoted to the study of special groups of continuous functions.

applied mathematics university of washington: Optimization Van Hien Nguyen, Jean-Jacques Strodiot, Patricia Tossings, 2012-12-06 The 9th Belgian-French-German Conference on Optimization has been held in Namur (Belgium) on September 7-11, 1998. This volume is a collection of papers presented at this Conference. Originally, this Conference was a French-German Conference but this year, in accordance with the organizers' wishes, a third country, Belgium, has joined the founding members of the Conference. Hence the name: Belgian French-German Conference on Optimization. Since the very beginning, the purpose of these Conferences has been to bring together researchers working in the area of Optimization and particularly to encourage young researchers to present their work. Most of the participants come from the organizing countries. However the general tendency is to invite outside researchers to attend the meeting. So this year, among the 101 participants at this Conference, twenty researchers came from other countries. The general theme of the Conference is everything that concerns the area of Optimization without specification of particular topics. So theoretical aspects of Optimization, in addition to applications and algorithms of Optimization, will be developed. However, and this point was very important for the organizers, the Conference must retain its convivial character. No more than two parallel sessions are organized. This would allow useful contacts between researchers to be promoted. The editors express their sincere thanks to all those who took part in this Conference. Their invaluable discussions have made this volume possible.

The question is whether the solutions of this system can be written in the form $\exp \Omega$ is a 2×2 matrix. A motivation for the problem is given, based on the question of defining lump constants for an inhomogeneous layer. Conditions necessary for the existence of Ω are given for a variety of
