Author Thomas O'Brien uses 20 inquiry-oriented discrepant events or hands-on explorations or demonstrations in which the outcomes are not what students expect to challenge students' preconceived ideas and urge them to critically examine the empirical evidence, draw logical inferences, and skeptically review their initial explanations with their peers. It is the perfect dual-purpose activity book for science teachers who aim to motivate their students while expanding their own scientific understanding.

bill nye the science guy energy: *Being and Becoming Scientists Today* Susan A. Kirch, Michele Amoroso, 2016-02-10 • Can I contribute to science? • Do I like to work on the problems of science? • How do scientists know what they know? • Would I like to be/become a scientist? These are questions that interest new science students. The authors provide teachers with an approach to foster and answer these questions by concentrating on learners and learning. They argue that students are typically taught from a disciplinary perspective of science. Using this lens students are viewed as people who need to learn a particular canon of information, methods, and ways of knowing about the world—a perspective that may be useful for practicing scientists, but not ideal for young learners. In this disciplinary approach to science education there is little room for development as a scientist. In contrast, the approach championed by Kirch and Amoroso places learner questions about the world at the forefront of teaching and learning and treats science as a system of human activity. The historical explorations, theoretical insights and practical advice presented here are appropriate for all ages and educational settings. In *Being and Becoming Scientists Today*, the authors provide: new tools for thinking about science, ideas for how to reveal

the multiple stories of knowledge production to learners, and approaches to teaching science as a collective process rather than a series of contributions made by (famous) individuals. In these ways, the authors promote the idea that all science learners contribute to the science in our lives.

bill nye the science guy energy: Channeling Violence James T. Hamilton, 2021-04-13 If it bleeds, it leads. The phrase captures television news directors' famed preference for opening newscasts with the most violent stories they can find. And what is true for news is often true for entertainment programming, where violence is used as a product to attract both viewers and sponsors. In this book, James Hamilton presents the first major theoretical and empirical examination of the market for television violence. Hamilton approaches television violence in the same way that other economists approach the problem of pollution: that is, as an example of market failure. He argues that television violence, like pollution, generates negative externalities, defined as costs borne by others than those involved in the production activity. Broadcasters seeking to attract viewers may not fully bear the costs to society of their violent programming, if those costs include such factors as increased levels of aggression and crime in society. Hamilton goes on to say that the comparison to pollution remains relevant when considering how to deal with the problem. Approaches devised to control violent programming, such as restricting it to certain times and rating programs according to the violence they contain, have parallels in zoning and education policies designed to protect the environment. Hamilton examines in detail the microstructure of incentives that operate at every level of television broadcasting, from programming and advertising to viewer behavior, so that remedies can be devised to reduce violent programming without restricting broadcasters' right to compete.
