1. What are Capital Markets?
Question: Explain the role of capital markets in the economy. Answer: Capital markets are financial markets where savings and investments are channelled between suppliers and those in need of capital. They enable businesses to raise funds by issuing equity or debt and allow investors to allocate their capital to productive ventures. They are crucial for fostering economic growth by facilitating efficient capital allocation.

2. What are the key types of capital markets? Question: Differentiate between primary and secondary capital markets. Answer: Primary Market: Where new securities are issued and sold to investors for the first time, e.g., IPOs (Initial Public Offerings). Secondary Market: Where existing securities are traded among investors, such as on stock exchanges like NYSE or NASDAQ.

3. What is the difference between the money market and the capital market? Answer: Money Market: Deals with short-term debt instruments (less than a year) like Treasury bills, commercial paper, and certificates of deposit. Capital Market: Focuses on long-term instruments like stocks, bonds, and debentures.

4. What is the role of a stock exchange? Answer: A stock exchange is a platform for buying and selling securities. It ensures transparency, liquidity, price discovery, and protection for investors through regulatory frameworks.

5. Explain the difference between equity financing and debt financing. Answer: Equity Financing: Raising capital

by selling ownership stakes in the form of shares. No repayment obligation but dilutes ownership.

Debt Financing: Borrowing money through loans or bonds. Must be repaid with interest but retains ownership.

6. What is an IPO, and how does it work? Answer: An Initial Public Offering (IPO) is when a private company sells its shares to the public for the first time to raise capital. The process involves underwriting, regulatory approvals, pricing, and listing the shares on a stock exchange.

7. What are derivatives, and why are they used in capital markets? Answer: Derivatives are financial instruments whose value is derived from an underlying asset (e.g., stocks, commodities, or currencies). They are used for hedging, speculation, and arbitrage.

Higher rates typically reduce stock prices as borrowing costs increase and bond yields become more attractive. Conversely, lower rates encourage investment and higher equity valuations.

9. What are the key financial ratios investors consider in capital markets? Answer: P/E Ratio (Price-to-Earnings): Measures stock valuation. Debt-to-Equity Ratio: Indicates financial leverage. ROE (Return on Equity): Shows profitability relative to equity. Current Ratio: Measures liquidity.

13. What is the role of credit rating agencies in capital markets? Answer: Credit rating agencies assess the creditworthiness of borrowers or debt instruments. Ratings like AAA, BBB, etc., provide investors with a measure of default risk, influencing borrowing costs and investment decisions.

interview questions for equity research analyst: Equity Trading & Dealer Interview Questions and Answers - English

Navneet Singh, Here are some common interview questions and answers related to equity trading and dealer positions. These questions focus on assessing your knowledge of the markets, technical skills, and ability to handle high-pressure environments.

1. What is the difference between a market maker and a broker in equity trading? Answer: A market maker is a firm or individual that stands ready to buy and sell securities at specified prices, maintaining liquidity in the market. They profit from the bid-ask spread. A broker, on the other hand,

facilitates transactions between buyers and sellers and earns a commission for their services. Brokers do not take on risk by holding securities in inventory.

2. Can you explain what a limit order and a market order are? Answer: A limit order is an order to buy or sell a stock at a specified price or better. For a buy order, it will only execute at the limit price or lower; for a sell order, it will only execute at the limit price or higher. A market order is an order to buy or sell a stock immediately at the current market price. Market orders are executed quickly but may not guarantee the exact price.

3. How do you evaluate whether a stock is undervalued or overvalued? Answer: I would evaluate the stock using a combination of fundamental analysis and technical analysis: Fundamental Analysis: I would analyse key metrics such as earnings per share (EPS), price-to-earnings (P/E) ratio, price-to-book (P/B) ratio, debt-to-equity ratio, and compare these with industry averages and historical performance. Technical Analysis: I would look at the stock's price action, moving averages, support and resistance levels, volume patterns, and indicators like RSI and MACD to gauge momentum and trends.

4. What is the role of risk management in equity trading? Answer: Risk management is crucial in equity trading to minimize potential losses and maximize returns. This includes: Position sizing: Determining how much capital to allocate to each trade. Stop-loss orders: Setting predefined levels where positions are automatically exited to limit losses. Diversification: Spreading risk by holding a mix of assets or securities. Hedging: Using instruments like options or futures to protect against market downturns.

5. What is a short sale and when would you consider doing it? Answer: A short sale is when you borrow shares of a stock and sell them at the current market price, hoping to buy them back later at a lower price. It is a bearish strategy, used when you believe a stock's price will decline. Shorting is often considered when there's strong conviction about overvaluation, poor fundamentals, or an expected downturn in the market or sector.

6. Explain the concept of liquidity and its importance in trading. Answer: Liquidity refers to how easily an asset can be bought or sold in the market without affecting its price. High liquidity means that there is a large number of buy and sell orders, and trades can be executed quickly at the market price. Liquidity is important because it allows traders to enter and exit positions efficiently without significant price slippage.

7. How would you handle a situation where a client has a large position in a stock that is moving sharply against them? Answer: I would evaluate the situation and consider the following: Market conditions: I'd look at the broader market sentiment and any news affecting the stock. Stop-losses: I'd ensure that appropriate stop-loss orders are in place to limit potential losses. Hedging: I might recommend hedging the position with options or futures to mitigate further losses. Position reduction: If the position is too large and the risk is too high, I'd consider reducing the size or exiting part of the position. Communication: I would communicate with the client to discuss the situation, explain potential outcomes, and provide suggestions.

8. What technical indicators do you rely on for equity trading? Answer: I rely on a combination of indicators: Moving Averages (e.g., 50-day, 200-day): Used to identify trends and potential reversal points. RSI (Relative Strength Index): Helps identify overbought or oversold conditions, suggesting potential reversal points. MACD (Moving Average Convergence Divergence): Useful for identifying momentum and trend changes. Bollinger Bands: To assess volatility and overbought/oversold levels. Volume: Helps confirm the strength of a price move.

9. What is your approach to dealing with market volatility? Answer: I would use several strategies to manage volatility: Hedging: Using options or futures to offset potential losses from a volatile market. Diversification: Ensuring that the portfolio is not overly exposed to any single asset or sector. Staying informed: Keeping an eye on market news and economic indicators to anticipate shifts. Discipline: Sticking to a well-defined risk management strategy, such as setting stop-loss orders and maintaining appropriate position sizes.

10. What is the role of an equity trader in a dealer position? Answer: An equity trader in a dealer position is responsible for making markets, which involves buying and selling equities to provide liquidity to clients or institutional investors. They quote bid-ask prices and may take on inventory risk, aiming to make a profit from the spread between the bid and ask prices. They also manage the firm's risk exposure by executing trades on behalf of clients and may use hedging strategies to protect against market moves. These questions and answers aim to test both technical and practical knowledge of

equity trading and the role of a dealer. Being prepared with solid answers to these types of questions can help you demonstrate both your trading expertise and your understanding of the markets.

interview questions for equity research analyst: *Financial Analyst interview questions - English*

Navneet Singh, Preparing for a financial analyst interview typically involves understanding core financial concepts, analytical skills, and the ability to interpret and present financial data. Here are some common financial analyst interview questions along with brief explanations or guidance on how to approach them:

Technical Questions: What is the difference between a Balance Sheet and an Income Statement? Answer: The Balance Sheet shows a company's financial position at a specific point in time, detailing assets, liabilities, and equity. The Income Statement shows a company's performance over a period, detailing revenues, expenses, and profits.

Walk me through a Discounted Cash Flow (DCF) analysis. Answer: Start by projecting the company's free cash flows for a period, then determine the terminal value, and discount these cash flows and the terminal value back to the present value using the WACC. Summarize by calculating the enterprise value and adjusting for net debt to arrive at equity value.

What are some common valuation methods? Answer: Common methods include Discounted Cash Flow (DCF) analysis, Comparable Company Analysis (Comps), Precedent Transactions, and Asset-Based Valuation.

How do you calculate Free Cash Flow (FCF)? Answer: Free Cash Flow is typically calculated as: $FCF = \text{Net Income} + \text{Depreciation/Amortization} - \text{Capital Expenditures} - \text{Changes in Working Capital}$

Note: Adjustments may vary depending on the context.

What is EBITDA, and why is it important? Answer: EBITDA stands for Earnings Before Interest, Taxes, Depreciation, and Amortization. It is a measure of a company's operating performance and is often used as a proxy for cash flow from operations.

How would you analyse a company's financial health? Answer: Examine key financial ratios, such as liquidity ratios (current ratio, quick ratio), profitability ratios (gross margin, return on equity), and leverage ratios (debt-to-equity, interest coverage). Additionally, analyse trends in revenue, expenses, and cash flow over time.

Explain the concept of the Weighted Average Cost of Capital (WACC). Answer: WACC is the average rate of return a company is expected to pay its investors for using their capital. It is

calculated by weighting the cost of equity and the cost of debt by their respective proportions in the company's capital structure. What is a sensitivity analysis? Answer: Sensitivity analysis involves changing one or more variables in a financial model to see how sensitive the outcomes are to these changes. It helps in assessing the risk and potential impact of different scenarios. How do you account for depreciation in financial models? Answer: Depreciation is typically a non-cash expense that reduces taxable income on the Income Statement. In cash flow analysis, it's added back to net income when calculating cash flow since it doesn't involve an actual outlay of cash. What is the difference between equity value and enterprise value? Answer: Equity value represents the value attributable to shareholders, calculated as market capitalization. Enterprise value represents the total value of a company, including debt and excluding cash, and is calculated as: $\text{Enterprise Value} = \text{Equity Value} + \text{Debt} - \text{Cash}$. Behavioural and Situational Questions: Describe a time when you used financial data to make a recommendation. Answer: Provide a specific example, detailing the problem, the data you analysed, the recommendation you made, and the outcome. Highlight your analytical process and decision-making skills. How do you prioritize tasks when working on multiple projects with tight deadlines? How do you stay updated with changes in the financial markets or industry? Answer: Mention specific sources you follow, such as financial news websites, industry reports, and professional networks. You could also discuss how you apply this knowledge in your analysis. Describe a challenging financial analysis project you worked on. What was the outcome? interview questions for equity research analyst: *Finance Intermediate Interview Questions - English* Navneet Singh, Here are some intermediate-level finance interview questions along with brief explanations or ideal answers: 1. Walk me through the three financial statements. Answer: The three main financial statements are: Income Statement: Shows the company's revenue and expenses over a specific period, resulting in net profit or loss. Balance Sheet: Provides a snapshot of the company's assets, liabilities, and shareholders' equity at a specific point in time. Cash Flow Statement: Reports the cash inflows and outflows from operating, investing, and financing activities over a period. 2. What is Working Capital, and how do you calculate it? Answer: Working capital measures, a company's operational efficiency and short-term financial health. It is calculated as: $\text{Working Capital} = \text{Current Assets} - \text{Current Liabilities}$ Positive working capital indicates that a company can cover its short-term liabilities with its short-term assets. 3. Explain the difference between IRR and NPV. Answer: IRR (Internal Rate of Return): The discount rate that makes the net present value (NPV) of all cash flows from a project equal to zero. It represents the project's expected rate of return. NPV (Net Present Value): The difference between the present value of cash inflows and the present value of cash outflows over a period. It shows the net value added by undertaking a project. 4. How do you perform a Discounted Cash Flow (DCF) analysis? Answer: Step 1: Forecast the company's free cash flows for a certain period. Step 2: Determine the discount rate (typically the weighted average cost of capital, WACC). Step 3: Calculate the terminal value (the value of the company's cash flows beyond the forecast period). Step 4: Discount the free cash flows and terminal value back to the present value. Step 5: Sum the present value of free cash flows and terminal value to get the enterprise value. 5. What is EBITDA, and why is it important? Answer: EBITDA stands for Earnings Before Interest, Taxes, Depreciation, and Amortization. It is a measure

of a company's operating performance and is often used as a proxy for cash flow. It is important because it removes the effects of financing and accounting decisions, providing a clearer view of a company's operational profitability. 6. Can you explain the concept of leverage? Answer: Leverage refers to using borrowed funds (debt) to amplify potential returns on investment. While leverage can increase the return on equity, it also increases the risk, as the company must service its debt regardless of its financial performance. 7. What factors would you consider when choosing between debt and equity financing? Answer: Cost of capital: Debt is often cheaper than equity, but too much debt increases financial risk. Control: Equity financing might dilute ownership, while debt doesn't affect ownership structure. Flexibility: Debt has fixed repayment schedules, while equity doesn't have mandatory payments. Market conditions: Interest rates and investor sentiment can influence the choice. 8. What is the difference between a stock's market value and intrinsic value? Answer: Market Value: The current price at which the stock is trading on the market. Intrinsic Value: The actual worth of the stock based on fundamental analysis, such as discounted cash flow analysis, which may differ from its market value. 9. How do you assess the creditworthiness of a company? Answer: Financial Ratios: Debt-to-equity ratio, interest coverage ratio, and current ratio. Cash Flow Analysis: Consistent positive cash flows are a good sign. Credit History: Past repayment behaviour, credit rating, and history of defaults. Industry Conditions: Overall health of the industry in which the company operates. 10. What is a sensitivity analysis, and why is it important? Answer: Sensitivity analysis examines how the variation in key assumptions (e.g., discount rate, growth rate) affects the outcome of a financial model. It helps in understanding the potential impact of changes in assumptions and provides insight into the risk and uncertainty of a decision. These questions are designed to test your understanding of key financial concepts and your ability to apply them in practical scenarios.
