New Castle Dysarthria Assessment: A Comprehensive Guide to Understanding and Evaluating Speech Disorders

new castle dysarthria assessment is an essential tool used by speech-language pathologists and healthcare professionals to evaluate and diagnose dysarthria, a motor speech disorder resulting from neurological impairments. Whether you are a clinician seeking to refine your assessment techniques or someone wanting to understand more about dysarthria evaluations, this article offers an in-depth look into how the New Castle Dysarthria Assessment works, why it is important, and what you can expect during the process.

What Is Dysarthria and Why Assess It?

Dysarthria is a condition characterized by impaired articulation, voice, and speech due to weakened or uncoordinated muscles involved in speaking. It often arises from neurological conditions such as stroke, Parkinson's disease, traumatic brain injury, or multiple sclerosis. Speech difficulties can significantly affect an individual's communication, social interactions, and overall quality of life.

Assessing dysarthria accurately is critical because it helps identify the severity and type of motor speech impairment, guides treatment planning, and monitors progress over time. The New Castle Dysarthria Assessment is particularly renowned for its comprehensive approach, combining observational and objective measures to capture the nuances of speech production challenges.

Understanding the New Castle Dysarthria Assessment

The New Castle Dysarthria Assessment (NCDA) is a standardized evaluation tool designed to assess different dimensions of dysarthric speech. Developed by specialists in speech pathology, it focuses on various parameters such as articulation, phonation, respiration, prosody, and resonance.

Key Components of the Assessment

The NCDA involves multiple tasks that allow clinicians to observe the patient's speech and motor abilities. Some of the primary components include:

- **Oral Motor Examination:** Evaluates strength, range, coordination, and speed of the

muscles involved in speech production, including lips, tongue, and jaw.

- **Speech Intelligibility Tests:** Measures how understandable the patient's speech is in different contexts, from isolated sounds to connected speech.
- **Phonatory and Respiratory Assessments:** Examines voice quality, volume control, breath support, and speech rhythm.
- **Prosody Evaluation:** Assesses intonation, stress patterns, and speech melody, which are often affected in dysarthria.

Each element contributes valuable information about the type of dysarthria—whether spastic, flaccid, ataxic, hypokinetic, hyperkinetic, or mixed—and helps in tailoring intervention strategies.

Why Choose the New Castle Dysarthria Assessment?

There are several reasons why clinicians might prefer the New Castle Dysarthria Assessment over other dysarthria evaluation tools:

Comprehensive and Detailed

Unlike some assessments that focus solely on speech intelligibility or oral motor function, the NCDA provides a holistic view. It considers all aspects that influence speech production, including neurological and muscular factors.

Standardized and Reliable

The tool has undergone rigorous testing to ensure reliability and validity, making it a trusted choice among speech therapists. Standardized scoring allows for consistent interpretation across different clinicians and settings.

Facilitates Targeted Therapy Planning

By identifying specific deficits in motor control or speech function, the assessment guides the development of individualized therapy programs. This targeted approach can lead to more effective speech rehabilitation outcomes.

How Is the New Castle Dysarthria Assessment Administered?

Conducting the NCDA typically requires a trained speech-language pathologist. The process usually unfolds in a clinical setting, but can also be adapted for home or hospital environments depending on the patient's condition.

Step-by-Step Process

1. **Initial Interview:** Gathering medical history, onset of symptoms, and communication concerns.
2. **Oral Motor Examination:** The clinician observes muscle movements, strength, and coordination through various exercises like lip puckering, tongue protrusion, and jaw movement.
3. **Speech Tasks:** The patient performs a series of speech tasks, from repeating single sounds and words to reading sentences and engaging in spontaneous conversation.
4. **Respiratory and Voice Assessment:** Breathing patterns and voice quality are evaluated, often using tools like a spirometer or acoustic analysis software.
5. **Scoring and Interpretation:** Each task is scored based on predefined criteria, and results are compiled to form a comprehensive profile of the patient's speech abilities.

Throughout this process, the clinician notes any inconsistencies, fatigue effects, or variability in speech, which are crucial for accurate diagnosis.

Integrating Technology in the New Castle Dysarthria Assessment

With advancements in speech therapy technology, the New Castle Dysarthria Assessment has evolved to incorporate digital tools that enhance precision and ease of use.

Acoustic Analysis Software

Software programs can analyze speech recordings to quantify parameters like pitch, loudness, and articulation rate. These objective measures complement clinical observations and provide detailed data for tracking progress.

Mobile Applications

Some speech pathology apps now include modules based on the NCDA framework, enabling remote assessments and teletherapy sessions. This is especially valuable for patients with limited access to in-person care.

Video Recording and Playback

Recording the assessment allows both clinicians and patients to review speech patterns, making therapy more interactive and informed.

Tips for Preparing for a New Castle Dysarthria Assessment

Whether you're a patient or caregiver, understanding what to expect can ease anxiety and improve assessment quality.

- **Rest Your Voice:** Avoid strenuous talking or shouting before the appointment to prevent fatigue affecting results.
- **Bring Medical Records:** Any previous neurological or speech therapy evaluations can help the clinician understand your history better.
- **Be Ready to Communicate:** The assessment involves various speaking tasks, so try to relax and take your time.
- **Ask Questions:** Clarify any doubts about the process or goals to stay engaged and informed.

Understanding the Results of the New Castle Dysarthria Assessment

After completion, the clinician will provide a detailed report highlighting the patient's strengths and challenges related to speech motor control.

What the Results Can Reveal

- The specific type of dysarthria present

- Severity level ranging from mild to severe
- Particular speech mechanisms that are impaired
- Recommendations for therapeutic interventions
- Prognosis based on underlying neurological conditions

This information is invaluable for guiding both immediate treatment and long-term communication strategies.

The Role of the New Castle Dysarthria Assessment in Therapy

Assessment is just the first step. The insights gained from the NCDA help speech-language pathologists design customized therapy plans that focus on improving muscle strength, coordination, breath support, and speech clarity.

Therapy may include:

- Oral motor exercises to enhance muscle function
- Breathing techniques to support speech production
- Articulation drills targeting specific sounds
- Use of augmentative and alternative communication (AAC) devices when necessary
- Strategies to improve prosody and speech naturalness

Regular reassessment using the New Castle Dysarthria Assessment can track progress and adjust interventions accordingly, ensuring that therapy remains effective and responsive to the patient's needs.

The New Castle Dysarthria Assessment stands out as a comprehensive and reliable approach to understanding and managing dysarthria. By carefully evaluating the multifaceted aspects of speech production, it empowers clinicians to deliver targeted care that can significantly enhance communication and quality of life for those affected by motor speech disorders. Whether you are a healthcare provider or someone navigating dysarthria, knowing about this assessment tool opens doors to more informed and effective speech therapy journeys.

Frequently Asked Questions

What is the New Castle Dysarthria Assessment?

The New Castle Dysarthria Assessment is a clinical tool used to evaluate the presence and severity of dysarthria, a motor speech disorder resulting from neurological injury.

How is the New Castle Dysarthria Assessment administered?

It is administered through a series of speech tasks that assess various speech components such as articulation, phonation, respiration, resonance, and prosody to identify dysarthric characteristics.

Who can benefit from the New Castle Dysarthria Assessment?

Individuals suspected of having speech impairments due to neurological conditions such as stroke, Parkinson's disease, or traumatic brain injury can benefit from this assessment.

What are the key components evaluated in the New Castle Dysarthria Assessment?

The assessment evaluates articulatory precision, speech intelligibility, voice quality, speech rate, and respiratory support for speech.

Is the New Castle Dysarthria Assessment suitable for all age groups?

Yes, the assessment can be adapted for use with both adult and pediatric populations, although it is primarily designed for adults with acquired neurological impairments.

How does the New Castle Dysarthria Assessment differ from other dysarthria assessments?

It provides a comprehensive and standardized approach focusing on both the perceptual and physiological aspects of speech production, allowing for detailed characterization of dysarthria types.

Can the New Castle Dysarthria Assessment guide treatment planning?

Yes, the results help clinicians identify specific speech subsystems affected, which informs targeted therapy interventions to improve communication effectiveness.

Are there any digital or app-based versions of the New

Castle Dysarthria Assessment?

Some clinics are developing digital tools to administer the assessment more efficiently, but the traditional version remains primarily paper-based and clinician-administered.

Where can clinicians access training for the New Castle Dysarthria Assessment?

Training is typically available through professional workshops, speech pathology conferences, and specialized courses offered by speech and language therapy organizations.

New Castle Dysarthria Assessment: A Comprehensive Review of Speech Motor Disorder Evaluation

new castle dysarthria assessment represents a critical advancement in the clinical evaluation of dysarthria, a motor speech disorder resulting from neurological impairment. This assessment tool, developed with an emphasis on precision and clinical relevance, aims to provide speech-language pathologists (SLPs) and neurologists with a structured framework to diagnose, classify, and monitor dysarthria in diverse patient populations. In this article, we delve into the methodology, clinical applications, and comparative advantages of the New Castle Dysarthria Assessment, while situating it within the broader context of speech motor disorder evaluations.

Understanding Dysarthria and Its Diagnostic Challenges

Dysarthria encompasses a group of speech disorders caused by impaired muscle control affecting respiration, phonation, articulation, resonance, and prosody. These impairments often arise from stroke, traumatic brain injury, neurodegenerative diseases such as Parkinson's or ALS, and other neurological conditions. Accurate diagnosis is essential because dysarthria subtypes—spastic, flaccid, ataxic, hypokinetic, hyperkinetic, and mixed—require different therapeutic approaches.

Historically, clinicians have relied on a combination of perceptual evaluation, instrumental measures, and standardized assessments to identify and classify dysarthria. However, variability in assessment protocols and subjective interpretation often limit diagnostic consistency. The New Castle Dysarthria Assessment seeks to address these limitations by providing a comprehensive, standardized protocol that integrates objective and subjective measures.

The New Castle Dysarthria Assessment: Features and Framework

At its core, the New Castle Dysarthria Assessment is designed to systematically evaluate the key components of speech affected by dysarthria. It incorporates multidimensional analysis covering:

- **Respiratory support and control:** Evaluating breath groups, speech timing, and maximum phonation duration.
- **Phonatory function:** Assessing voice quality, pitch, loudness, and stability.
- **Articulatory precision:** Measuring clarity and accuracy of consonant and vowel production.
- **Resonance:** Detecting hypernasality or hyponasality through perceptual and instrumental methods.
- **Prosody:** Analyzing rhythm, stress patterns, and intonation contours.

This assessment protocol blends clinical observation, patient-reported symptoms, and instrumental data such as acoustic analyses and aerodynamic measurements. Its structured scoring system enables clinicians to quantify severity and track progression over time.

Standardized Tasks and Scoring

The New Castle Dysarthria Assessment uses a battery of speech tasks to elicit targeted speech samples. These include sustained vowel phonation, repetition of syllables (e.g., diadochokinesis tasks), spontaneous speech, and reading passages. Each task is scored based on predefined criteria, allowing for objective comparison across sessions.

For example, diadochokinetic rate tests measure rapid alternating movements, which are sensitive to neuromotor deficits. The assessment's scoring rubric grades performance on parameters like rate, regularity, and precision, offering a nuanced profile of motor speech control.

Clinical Utility and Comparative Advantages

One of the key strengths of the New Castle Dysarthria Assessment lies in its ability to integrate perceptual and instrumental data seamlessly. While many traditional assessments rely heavily on clinician judgment, this tool's incorporation of acoustic analysis tools—such as spectrographic evaluation and nasometry—enhances diagnostic accuracy.

Furthermore, the assessment's modular design allows practitioners to tailor evaluations based on patient needs and clinical settings. For example, in acute care, a brief screening version facilitates rapid identification of speech motor deficits, while the full protocol supports detailed diagnostic workups in outpatient or rehabilitation environments.

When compared to other prominent dysarthria assessments—such as the Frenchay Dysarthria Assessment (FDA-2), the Assessment of Intelligibility of Dysarthric Speech (AIDS), or the Mayo Clinic Dysarthria Classification System—the New Castle Dysarthria Assessment offers several distinctive benefits:

- **Comprehensive multidimensional approach:** Covers all speech subsystems systematically.
- **Standardization with objectivity:** Incorporates both perceptual and instrumental measures, reducing subjective bias.
- **Flexibility:** Modular format accommodates diverse clinical needs and patient abilities.
- **Tracking and monitoring:** Quantitative scoring facilitates longitudinal monitoring of disease progression or therapy outcomes.

However, some limitations include the need for specialized equipment for acoustic and aerodynamic measurements, which may restrict its use in resource-limited settings. Additionally, clinicians require training to interpret the detailed data outputs effectively.

Comparisons with Other Dysarthria Assessments

The FDA-2, widely used for its ease and comprehensive clinical coverage, primarily relies on perceptual judgments and structured tasks. While it provides valuable data on speech components, it lacks the quantitative precision offered by the New Castle tool's instrumental integration.

The AIDS focuses on speech intelligibility through standardized word and sentence repetition tasks, which is crucial for functional communication assessment but less informative regarding underlying neuromotor impairments.

The Mayo Clinic Dysarthria Classification System offers an etiological framework but does not provide a standardized scoring mechanism for severity or progression.

By bridging these gaps, the New Castle Dysarthria Assessment enhances both diagnostic depth and clinical utility.

Implementing the New Castle Dysarthria Assessment in Clinical Practice

Effective implementation requires careful consideration of workflow and resource availability. Clinicians interested in adopting the New Castle Dysarthria Assessment

should prioritize:

- **Training and Calibration:** Familiarization with task administration protocols and scoring criteria is essential to ensure consistency.
- **Access to Instrumentation:** Acoustic analysis software, nasometry devices, and aerodynamic measurement tools are recommended to leverage the assessment's full capabilities.
- **Patient-Centered Adaptations:** Adjusting task complexity and duration to accommodate fatigue, cognitive status, and speech severity.
- **Integration with Multidisciplinary Teams:** Collaboration with neurologists, rehabilitation specialists, and caregivers enhances comprehensive care planning.

Additionally, the assessment's quantitative nature facilitates data-driven decision-making, enabling clinicians to tailor therapy goals and objectively evaluate treatment efficacy.

Research Implications and Future Directions

Emerging research increasingly underscores the importance of objective measures in dysarthria evaluation. The New Castle Dysarthria Assessment's incorporation of acoustic and aerodynamic metrics aligns with contemporary trends emphasizing technology-assisted diagnostics.

Ongoing studies are exploring the assessment's sensitivity in detecting early-stage dysarthria, particularly in progressive conditions such as Parkinson's disease and multiple sclerosis. Its potential role in telepractice settings, leveraging remote acoustic analysis, is also under investigation.

Moreover, integration with machine learning algorithms could further enhance diagnostic precision by identifying subtle speech pattern abnormalities invisible to the human ear.

As speech pathology continues to evolve towards personalized medicine, tools like the New Castle Dysarthria Assessment will likely become indispensable components of comprehensive neurological evaluation.

The landscape of dysarthria assessment is marked by a continuous effort to refine diagnostic accuracy and clinical relevance. The New Castle Dysarthria Assessment exemplifies this progress by offering a robust, multidimensional approach that merges clinical expertise with technological innovation. Its growing adoption reflects a broader commitment within the field to improve outcomes for individuals affected by speech motor disorders.

new castle dysarthria assessment: *Assessment in Speech-Language Pathology* Kenneth G. Shipley, Julie G. McAfee, 2023-11-10 *Assessment in Speech-Language Pathology: A Resource Manual*, Seventh Edition is the bestselling book on assessment for academic courses and clinical practice. The book covers the diagnosis and evaluation of a wide range of communication disorders in children and adults. This one-of-a-kind manual provides a comprehensive package of reference materials, explanations of assessment procedures, and practical stimulus suggestion. Many reproducible worksheets, forms, reports, and quick-reference tables are provided. Each chapter references many of the most used published tests and resources for assessing the given disorder. Multiple links are provided for online testing materials, including some standardized tests. This highly practical resource is separated into two easy-to-navigate sections: Part I highlights preparatory considerations; Part II provides materials and suggestions for assessing communicative disorders. New to the Seventh Edition: * New chapter describing an assessment from start to finish * Reorganized and expanded content on psychometric principles of assessment * New information on assessment via telepractice * New information on play-based assessment * New information on sharing electronic medical information * Reorganized and expanded content on medical and psychological conditions associated with communicative disorders * Several new tables and figures throughout to improve ease of understanding the material * Several new forms and worksheets for assessment * Updates to each chapter to reflect current research and practice * Updated and new recommendations for published assessment tools, sources of additional information, online resources, and apps * Multiple links to online assessment resources, including free materials and standardized testing materials Key Features: * Full-color design with images, charts, and illustrations to engage readers and display key concepts * Each chapter concludes with practical forms, including worksheets, checklists, and additional sources of information * Glossary of key terms Disclaimer: Please note that ancillary content (such as eFlashcards, quizzes, and downloadable versions of the forms and worksheets) are not be included as published in the original print version of this book.

new castle dysarthria assessment: Improving Speech Intelligibility in Adults Connie K. Porcaro, 2022-09-23 Being intelligible to a listener means getting your message across and improving speech intelligibility is one of the most common goals for clients working with a speech-language pathologist (SLP). *Improving Speech Intelligibility in Adults: Clinical Application of Evidence-Based Strategies* is a professional resource for practicing SLPs working with adults with communication disorders, such as dysarthria, acquired apraxia of speech, and voice disorders. This book incorporates current research findings to support the use of evidence-based strategies in clinical situations. While other books may focus on “drilling” and “practicing” a list of words, sentences, and topics to use with a client to change their behaviors, *Improving Speech Intelligibility in Adults* uniquely focuses on the speaker and the listener in tandem. The author takes a noteworthy approach in how the listener can change behaviors to assist with understanding. The text presents a comprehensive approach to improving speech intelligibility by including ways to enhance the communication environment during in-person or teletherapy exchanges to enhance understanding between speaker and listener.

new castle dysarthria assessment: Cognitive Retraining Using Microcomputers Veronica A. Bradley, John L. Welch, Clive E. Skilbeck, 1993 The last decade has seen considerable development in the field of neuropsychological rehabilitation following brain damage, and the use of computerized methods has attracted attention and stimulated controversy. This practically-oriented text reviews representative examples from the literature relating to the training of cognitive systems with the emphasis on studies describing the use of computerized methods. The topic is discussed in context and the contents include sections on cognitive change in neurological disorders, assessment

techniques, the interaction between cognition and behaviour and the advantages and disadvantages of the use of microcomputers. The authors describe the evaluation of a computerized cognitive retraining programme run at the Regional Neurological Centre in Newcastle-upon-Tyne and draw on their experience of running such programmes to give practical guidance to those wishing to set up cognitive retraining programmes.

new castle dysarthria assessment: One Child John Apley, Christopher Ounsted, 1982-04-22 'The Cartesian split of human creatures into psyche and soma has had a profoundly bad influence on the medical care of children.' In fact the concept of psychosomatic disease as a separate entirely false one, there being an illness that does not in some way affect behaviour, and no behaviour which is not in some way mediated by physiological factors. However, the subtleties of our understanding of child illness have gone much further than simply unmasking this false dichotomy. This book will now unveil the parts played by other features of the broader environment - the family, stress, socioeconomic factors - and other predicaments, including that of loving and being loved. To understand the child within these wider terms, the professionals involved in helping the child and the parents must in some way be given a new perspective, a broader view. One Child provides this perspective, stepping outside conventional presentations into the more exciting possibilities of reassessing the influences and rôles of the disease itself and the environment in which it arises. This represents challenge and will inevitably cause controversy, which should itself push the perspectives further.

new castle dysarthria assessment: Assessment in Speech and Language Therapy John R. Beech, Leonora Harding, 2018-10-31 What assessment tests are available to speech therapists? How are they best used? Originally published in 1993, *Assessment in Speech and Language Therapy* was designed to guide speech therapists in choosing the most appropriate assessments for evaluation, monitoring and intervention at the time. By providing guidance on defining the issues in assessment, it shows how to make sure that the process will produce a result relevant to the therapist's own needs and those of his or her clients. The major issues involved are discussed in detail, in particular how to make sure that assessments are relevant to individual needs. This title will be invaluable to all speech therapists and clinical psychologists working in this area.

new castle dysarthria assessment: **Voice Quality Measurement** Raymond D. Kent, Martin John Ball, 2000 This comprehensive book explores the many facets of measuring voice quality. Voice quality is a concept that is widely recognized and applied, yet very difficult to define in a way that is universally satisfactory. A number of experts consider such topics as perceptual assessment, instrumental (objective) assessment, and various voice states and disorders. Contributors with a wide scope of experience present perspectives and ideas on how voice quality can be assessed with improved validity and reliability.

new castle dysarthria assessment: *Aphasia and Related Neurogenic Communication Disorders* Ilias Papathanasiou, Patrick Coppens, 2021-06-03 *Aphasia and Related Neurogenic Communication Disorders* is designed for the graduate course on Aphasia. Part 1 of the textbook covers aphasiology, while part 2 addresses related disorders. Overall, the textbook offers an overview of aphasia and related neurogenic communication disorders by presenting important

recent advances and clinically relevant information. It emphasizes Evidence Based Practice by critically reviewing the pertinent literature and its relevance for best clinical practices. Case studies in all clinical chapters illustrate key topics, and a Future Directions section in each chapter provides insight on where the field may be headed. The WHO ICF Framework is introduced in the beginning of the text and then reinforced and infused throughout--

new castle dysarthria assessment: *Clinical Cases in Dysarthria* Margaret Walshe, Nick Miller, 2021-12-21 Through the medium of detailed clinical case reports, written by well-respected clinicians and researchers working internationally in the field, Clinical Cases in Dysarthria discusses the challenges, and rewards of applying evidence-based procedures to people with dysarthria in real-life busy routine clinical settings. The text opens with an introduction to the latest research and practices within dysarthria treatment and sets the scene for the eight individual case reports which follow. These case reports form the core chapters of the text and cover themes that range from clinical diagnostic conundrums to applying popular, and/or novel intervention approaches to different populations where dysarthria presents. Each chapter has a specific argument drawing on theoretical principles of assessment and rehabilitation, incorporating latest research evidence to help readers problem-solve similar cases in their clinical practice. Throughout the text, readers are encouraged to 'think outside the box'. This book will be essential for undergraduate and postgraduate student clinicians within speech and language therapy/pathology courses, as well as clinicians new to the field of dysarthria.

new castle dysarthria assessment: *Motor Speech Disorders* Nick Miller, Anja Lowit, 2014-08-04 This book investigates cross-language aspects of motor speech disorders, including their assessment and treatment as well as the underlying neurophysiological and neuropsychological disruptions that bring about disorders of speech motor control.

new castle dysarthria assessment: *The Handbook of Clinical Linguistics* Martin J. Ball, Nicole Müller, Elizabeth Spencer, 2024-01-09 The new edition of the leading reference work on Clinical Linguistics, fully updated with new research and developments in the field The Handbook of Clinical Linguistics, Second Edition provides a timely and authoritative survey of this interdisciplinary field, exploring the application of linguistic theory and method to the study of speech and language disorders. Containing 42 in-depth chapters by an international panel of established and rising scholars, this classic volume addresses a wide range of pathologies while offering valuable insights into key theory and research, multilingual and cross-linguistics factors, analysis and assessment methods, and more. Now in its second edition, The Handbook of Clinical Linguistics features nine entirely new chapters on clinical corpus linguistics, multimodal analysis, cognition and language, the linguistics of sign languages, clinical phonotactics, typical and nontypical phonological development, clinical phonology and phonological assessment, and two chapters on instrumental analysis of voice and speech production. Revised and expanded chapters incorporate new research in clinical linguistics and place greater emphasis on specific speech disorders, connections to literacy, and multilingualism. This invaluable reference works: Reflects the latest developments in new research and data, as well as changing perspectives about the priorities and future of the field Features new and revised chapters throughout, many with new authors or authorial teams Offers well-rounded coverage of the major areas of the speech sciences in the study of communication disorders Discusses how mainstream theories and descriptions of language are influenced by clinical research Building on the success of the first edition, The Handbook of Clinical Linguistics, Second Edition, is an indispensable resource for researchers and advanced students across all areas of speech-language sciences, including speech disorders, speech pathology, speech

therapy, communication disorders, cognitive linguistics, and neurolinguistics.

new castle dysarthria assessment: *Language Development and Disorders* W. Yule, M. Rutter, 1987 Communication disabilities are common, although their precise nature and degree of severity vary greatly among individuals. They are among the most handicapping of disabilities because they isolate a person and in so doing restrict social, educational, and occupational opportunities. One of the purposes of this book was to bring together theoretical, practical, and clinical knowledge from several disciplines that bear on language and communication into some reasonably accessible form. The intent is to provide a broad and multi-faceted view of language development and language disorders. Thus, contributions from education, linguistics, psychology, pediatrics, psychiatry, neurology, neuropsychology, and speech therapy are included. They describe our current knowledge of language development, suggest classifications for language pathology, outline what is known of the epidemiology of language difficulties, consider assessment and therapy, alternative communication systems and the impact of the new technology on communication aids. The variety of perspectives that it provides will make it particularly useful to the range of specialists who are concerned with the development of communication skills and language disorders.

new castle dysarthria assessment: Clinical Neuropsychology of Alcoholism Robert G Knight, Barry E. Longmore, 2013-06-17 Alcohol abuse is a major health problem in most parts of the world. This book focuses on the way in which alcohol affects the brain, with the aim of describing advances in the neuropsychology of alcoholism in a way that makes this work accessible to clinicians from a variety of backgrounds who treat people with alcohol-related problems.; The book is divided into four parts. Part One provides an introduction to the medical and neurological conditions that

can result from alcoholism, and to the process of neuropsychological assessment. The problems involved in conducting research in this area are also considered. In Part Two, research that focuses directly on changes to the nervous system is surveyed. This includes studies of both the short-term and the chronic neurological changes in the brain caused by alcohol. In Part Three, studies of the neuropsychological effects of acute intoxication, social drinking and alcohol abuse are described. Finally, in Part Four, the implications of neuropsychological research for the assessment and management of patients with alcohol problems are considered. The objective of this book is to collate the range of research work that is relevant to understanding how alcohol affects the brain. This includes both the acute and the chronic effects, at both the biological and physiological levels.
